GUIDE TO THE SECREST ARBORETUM
OHIO AGRICULTURAL RESEARCH AND DEVELOPMENT CENTER
WOOSTER, OHIO

John E. Ford, Curator

The Secrest Arboretum consists of approximately 85 acres of land. Over 2,000 species, varieties or cultivars of trees and shrubs are presently growing in the Arboretum. The oldest remaining planted trees are Yellowpoplar (Plot A 27), Northern Catalpa (Plot A 1) and European Larch (Plot A 6a). All of these trees were outplanted in 1903.

The Arboretum has been divided into 13 compartments, each identified by a letter. The map on the inside of the front cover is an orientation map to locate compartments. Each compartment has been subdivided into plots and individual maps have been prepared of each compartment showing subdivisions into plots. These are arranged alphabetically throughout the Finding Guide. Plot maps show location within the plot. Locations within each plot vary. A few plots have randomized plantings, the remaining plots have plantings on a regular coordinate spacing usually 12 feet apart. See individual plot maps for spacing. Each location has been assigned a number except in randomized plots where each plant has been assigned a number.

Plants may be located by two methods in each plot.

1. The first listing for each plot is alphabetical by technical name.

Thus, in Plot A 30

Taxus baccata 'Nigra' -

BLACK ENGLISH YEW - 194

This indicates that Taxus baccata 'Nigra' is at location 194 in Plot A 30, which can be located on the individual plot map for A 30. Most plants have a sign with the common name, the technical name, location number, and date outplanted.

2. The second listing is numerical by location and should aid in locating plants in a plot in relation to each other. If a sign is missing, the plant can still be located and identified by measuring from the nearest plant having a sign with location. A number with no name in the listing indicates an open space in the plot.

The index is an alphabetical cross reference list of plants indicated in the various compartments and plots. In most cases, nomenclature is in accordance with Den Ouden and Boom¹, Standardized Plant Names², Little³, or Rehder⁴.

A great many different plants, both native and exotic, have self-seeded into plots. A listing of those that are fairly common starts on page 3. From time to time some of these plants may be removed during brush control measures or may be found as sprout growth.

New plants are being constantly added each year. Some plants are removed each year due to thinning, mortality or unsuitability, making a finding guide somewhat out of date in a short time.

SELF SEEDED PLANTS

The following plants have self seeded in existing plots in numbers enough to be easily located. Many have been periodically mowed off so may presently be multiple stemmed sprout growth. Many exotics are becoming established in the Arboretum especially underneath forest type plantings. No attempt has been made to include all plants that may be found as in many cases only two or three plants may be located in a plot. The following plants are not labeled.
